Advances In Motor Learning And Control

Motor learning is generally defined as a set of processes aimed at learning and refining new skills by practicing them (Nieuwboer, Rochester, Muncks, & Swinnen, 2009). Motor learning processes strictly depend on the structural integrity and functional activity of the cortico-striatal loop and cerebellum (Nieuwboer et al., 2009). Considering the above mentioned functional alterations occurring in the brain networks, PD patients may have difficulties in motor learning that can impact on motor ...

Motor Learning - an overview | ScienceDirect Topics

Motor Learning study focuses on the behavioral, biomechanical, and neural bases of development, acquisition, and performance of functional movement skills. Acquisition of skill is examined over the life span in typically developing children and adults and individuals with movement disorders. Movement analysis is used to elucidate the neuromotor control processes underlying skilled performance in everyday functional behaviors.
