Blending cutting-edge science with her own behind-the-scenes insights as a leading researcher in the field, acclaimed theoretical physicist Katherine Freese recounts the hunt for dark matter, from the discoveries of visionary scientists like Fritz Zwicky - the Swiss astronomer who coined the term “dark matter” in 1933 - to the deluge of data today from underground laboratories, satellites in space, and the Large Hadron Collider.

Freese, a professor of physics at the University of Michigan, begins this exploration into the mystery of dark matter by relating her journey to become one of the field’s early researchers. Years of collecting data and positing unknown cosmic entities led to the probable existence of this substance, and evidence slowly began to appear despite scientists’ inability to quantify the “collisionless dark matter.”

Freese is a theoretical astrophysicist, who splits her time between the University of Michigan and Stockholm University. She has dedicated her career to untangling some of physics’ greatest mysteries — cooking up thrilling ideas about the cosmos, disproving others — while knocking down barriers for women in a famously male-dominated field.

She has been working to identify the dark matter and dark energy that permeate the universe as well as to build a successful model for the early universe immediately after the Big Bang. Dr. Freese has been awarded an Honorary Doctorate (honoris cause) from the University of Stockholm in September 2012. She is a Fellow of the American Physical Society.

Dark Matter and Our Universe

Freese describes the larger-than-life characters and clashing personalities behind the race to identify these elusive particles. Many cosmologists believe we are on the verge of solving the mystery. The Cosmic Cocktail provides the foundation needed to fully fathom this epochal moment in humankind's quest to understand the universe.

The cosmic-ray contribution is 0.3 mSv/yr at sea level and increases at higher elevations. Cosmic-ray muons deposit far more energy in the human body than do WIMPs. These muons pass through the human body at a rate of a few per second, depositing $\sim 10 - 100$ MeV of energy each, far larger than the ~ 10 keV deposited by a WIMP.
