Fetter & Walecka, Problem 6.10 a) The Lagrangian of the system is given by equation (20.26)  $L = \frac{1}{2} m \dot{\alpha}^2 + \frac{1}{2} m \dot{\beta}^2 + 2m\dot{\alpha}\dot{\beta}\cos\alpha$ , and the generalized momentum by equation (20.27)  $p = m\dot{\alpha}(1 + \cos\alpha) + \dot{\beta}$ , which we can invert to  $\dot{\alpha} = \frac{p - \dot{\beta}}{m(1 + \cos\alpha)}$ . The Hamiltonian in equation (20.28) then becomes

This mismatch is something of an issue; the coverage of material is rather vague compared to the detail of the problems which makes a course based on this text rather frustrating at times. The mechanics texts by Goldstein and Arnold (for those more into mathematics) are superior to Fetter and Walecka while covering most of the same material.

We present experimental data and theoretical results for valence-band satellites in semiconductors, using the prototypical example of bulk silicon. In a previous publication we introduced a new approach that allows us to describe satellites in valence photoemission spectroscopy, in good agreement with experiment. Here we give more details; we show how the spectra change with photon energy ...

In this paper we present an acoustic propagation model that approximates a porous medium as a fluid with a bulk modulus and effective density derived from Biot theory. Within the framework of Biot theory it is assumed here that the porous medium has low values of frame bulk and shear moduli relative to the other moduli of the medium and these low values are approximated as zero.
