Seventeen Simple Lectures On General

In this book, a collection of seventeen lectures, the author attempts to examine what he calls the uncertainties and perplexities that he encountered when studying the general theory of relativity. He states in the preface that he is not a philosopher of science, but his approach in the lectures could be classified as philosophical.

17.1 Effective potential | Energy equation : $E = \frac{1}{2} m \dot{r}^2 + J^2 m r^2 + U(r)$ | Define effective potential : $U_{\text{eff}}(r) = \frac{1}{2} m \dot{r}^2 + U(r)$!then $E = \frac{1}{2} m \dot{r}_2^2 + U_{\text{eff}}(r)$ | Note this has the same form as a 1-D energy expression :! $E = \frac{1}{2} m \dot{x}_2^2 + U(x)$!the analysis becomes 1-D-like problem since $J = \text{const}$ | Allows to predict important features of motion without solving the radial equation

Classical Mechanics LECTURE 17: EFFECTIVE POTENTIAL ...

As shown in his "17 simple lectures", his understanding of general relativity made him clearly stay away from and criticise the parlance of the mainstream following J. A. Wheeler when speaking of "mass-energy curving space", " black hole " (in place of the physically more appealing "occluded star", or "frozen star") and, in the frame of quantum gravity, of "foamlike 3-geometry".

Thus, a simple harmonic motion can be modeled by one of the following functions: $y = a \cos(2\pi f)t$ or $y = a \sin(2\pi f)t$ where a is the amplitude. Remark 17.1 1. If maximum displacement occurs at $t = 0$ then the motion is modeled by the cosine function. 2. If zero displacement occurs at $t = 0$ then the motion is modeled by the sine function. Example 17.1
